Arduino

Arduino's overview

Entry-Level Boards

1. Arduino UNO R4 Minima

- **Price**: ~$20
- **Main Purpose**: Beginner-friendly board for learning electronics and programming.
- **Capabilities**: HID support (keyboard/mouse emulation), no built-in Wi-Fi or Bluetooth.
- **Memory**: 32 KB SRAM, 256 KB Flash, 8 KB EEPROM.

2. Arduino UNO R4 WiFi

- **Price**: ~$27
- **Main Purpose**: Enhanced UNO for IoT and creative projects with wireless features.
- **Capabilities**: Wi-Fi, Bluetooth (via ESP32-S3), HID support, 12x8 LED matrix, Qwiic connector.
- **Memory**: 32 KB SRAM (RA4M1), 512 KB SRAM (ESP32-S3), 256 KB Flash (RA4M1).

3. Arduino Nano Every

- **Price**: ~$13
- **Main Purpose**: Compact, affordable board for small projects and prototyping.
- **Capabilities**: No Wi-Fi or Bluetooth, no HID support natively.
- **Memory**: 6 KB SRAM, 48 KB Flash.

4. ### Arduino Leonardo

   - **Price**: ~$25
   - **Main Purpose**: USB-focused projects and HID applications.
   - **Capabilities**: Native USB communication, HID support (can act as keyboard/mouse), no Wi-Fi or Bluetooth.
   - **Memory**: 2.5 KB SRAM, 32 KB Flash, 1 KB EEPROM

Enhanced Boards

4. ### Arduino Mega 2560 Rev3

   - **Price**: ~$48
   - **Main Purpose**: Advanced projects needing many I/O pins and higher memory.
   - **Capabilities**: No Wi-Fi or Bluetooth, no HID support natively, 54 digital I/O pins.
   - **Memory**: 8 KB SRAM, 256 KB Flash, 4 KB EEPROM.

5. ### Arduino Due

   - **Price**: ~$45
   - **Main Purpose**: High-performance projects requiring 32-bit processing.
   - **Capabilities**: No Wi-Fi or Bluetooth, HID support, DAC for analog output.
   - **Memory**: 96 KB SRAM, 512 KB Flash.

IoT-Focused Boards

6. ### Arduino Nano 33 IoT

   - **Price**: ~$25

- **Main Purpose**: Small IoT projects with wireless connectivity.
- **Capabilities**: Wi-Fi, Bluetooth, HID support, onboard crypto chip.
- **Memory**: 32 KB SRAM, 256 KB Flash.

7. Arduino Nano 33 BLE

- **Price**: ~$28
- **Main Purpose**: IoT and wearable projects with Bluetooth focus.
- **Capabilities**: Bluetooth Low Energy (BLE), HID support, no Wi-Fi, onboard IMU.
- **Memory**: 256 KB SRAM, 1 MB Flash.

8. Arduino Nano ESP32

- **Price**: ~$20
- **Main Purpose**: Compact IoT with high-performance ESP32 capabilities.
- **Capabilities**: Wi-Fi, Bluetooth, HID support, MicroPython support.
- **Memory**: 520 KB SRAM, 16 MB Flash (external).

9. Arduino MKR WiFi 1010

- **Price**: ~$40
- **Main Purpose**: IoT projects with secure wireless communication.
- **Capabilities**: Wi-Fi, Bluetooth, HID support, onboard crypto chip.
- **Memory**: 32 KB SRAM, 256 KB Flash.

10. Arduino GIGA R1 WiFi

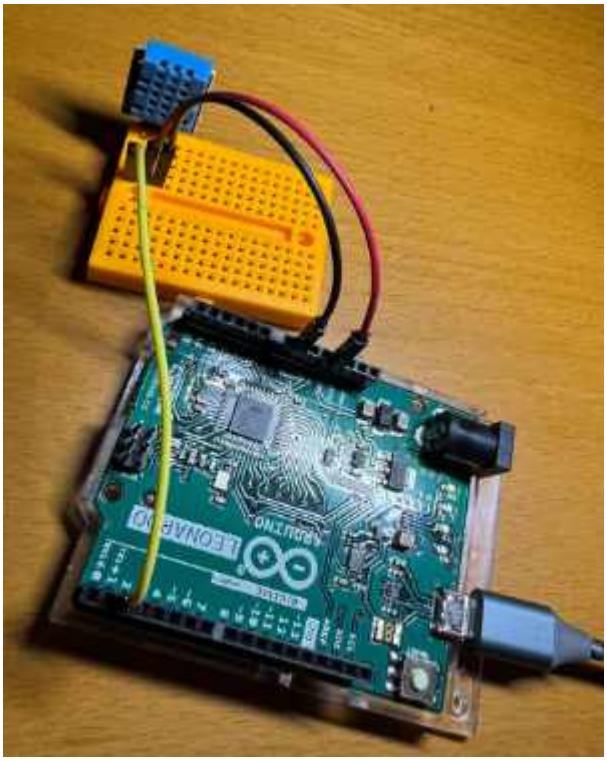
- **Price**: ~$75
- **Main Purpose**: Advanced, large-scale projects with multimedia and connectivity.
- **Capabilities**: Wi-Fi, Bluetooth, HID support, dual-core MCU, camera/display support.
- **Memory**: 576 KB SRAM (M7 core) + 256 KB (M4 core), 2 MB Flash.

11. ## Arduino Portenta H7

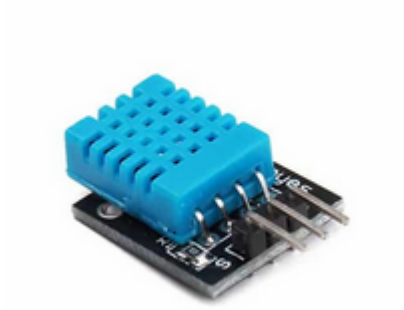
- **Price**: ~$110
- **Main Purpose**: Industrial-grade, high-performance IoT and AI applications.
- **Capabilities**: Wi-Fi, Bluetooth, HID support, dual-core MCU, high-speed I/O.
- **Memory**: 2 MB SRAM (total), 16 MB Flash (external).

Temperatuur en luchtvochtigheid

Temperatuur en luchtvochtigheid



DHT11



DHT11; van links naar rechts: *signaal* (naar port 2), *3.3V, GRND*.
Let op er zijn meerdere varianten en bij de meeste zit de data in het midden.

(https://elektronicavoorjou.nl/product/dht11-temperatuur-en-vochtigheid-sensor/)

Output

```
1
Temperature: 20.5 °C
Humidity:    45 %
2
Temperature: 20.5 °C
Humidity:    45 %
...
```

Code

```
#include <DHT.h>

#define DHTPIN 2          // Pin connected to the DHT11 data pin
#define DHTTYPE DHT11     // Specify DHT11 sensor

DHT dht(DHTPIN, DHTTYPE);
int count;

void setup() {
  Serial.begin(9600);
  dht.begin();
  count = 0;
  delay(5000);
}

void loop() {
  count++;
  delay(2000); // Wait 2 seconds between readings (DHT11 needs time)

  float temp = dht.readTemperature(); // Read temperature as a float
  int humidity = dht.readHumidity();

  if (isnan(temp)) {
```

```
    Serial.println("Failed to read from DHT sensor!");
  } else {
    Serial.println(count);

    Serial.print("Temperature: ");
    Serial.print(temp, 1);
    Serial.println(" °C");

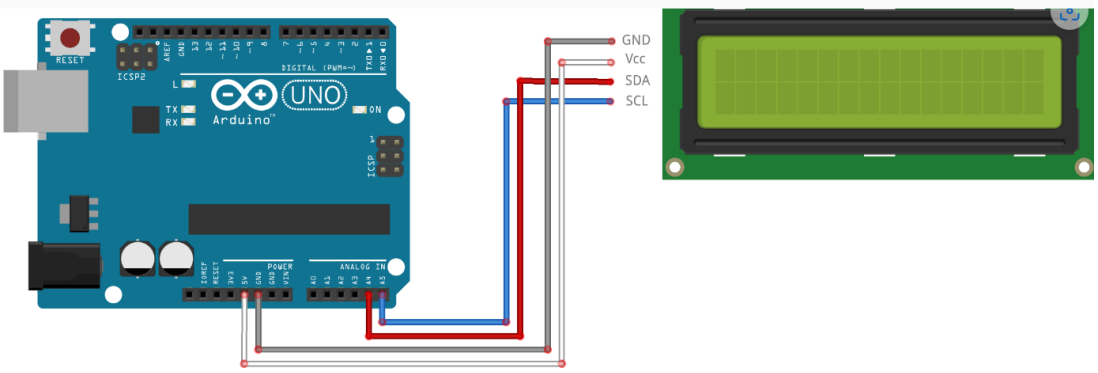
    Serial.print("Humidity:    ");
    Serial.print(humidity);
    Serial.println(" %");

    Serial.println("");
  }
}
```

Display

1602 LCD Module Display Bundle with I2C interface 2x16 Characters

Aansluitschema



Let op: de pin configuratie verschilt per type Arduino

Uno, Ethernet	A4 (SDA), A5 (SCL)
Mega2560	20 (SDA), 21 (SCL)
Leonardo	2 (SDA), 3 (SCL)
Due	20 (SDA), 21 (SCL) of SDA1, SCL1

Thermometer bewegingsmelder en clock

Thermometer bewegingsmelder en clock

Het display laat de temperatuur en luchtvochtigheid zien en toont de trend met een pijltje omhoog of naar beneden.

Op de tweede regel staat de datum en tijd.

Het display gaat alleen 'aan' als er beweiging wordt geconstateerd.

Gemeten stroom is ongeveer 40 mA voor de gehele schakeling.

Aansuitschema

PIR Bewegingsmelder

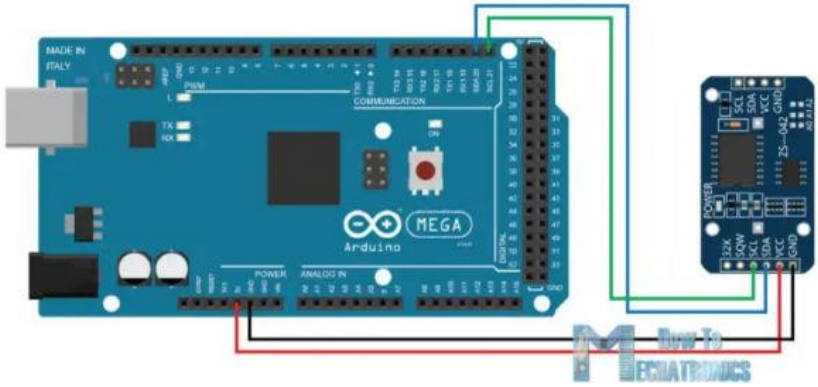
Van onder gezien van links naar rechts
(Let op er zijn verschillende pin configuraties. Verwijder lans/cap om de pin configuratie te zien).

- Plus 5V

- Signaal naar Pin 12 Arduino Leonarde.
- Min

Signaal naar Digitaal pin 12 Arduono Leonarde

Clock DS 3231



http://www.rinkydinkelectronics.com/library.php?id=73

Van links naar rechts van onderkant (niet batterij kant) gezien en *laatste* 4 pootjes.

- SCL naar SCL op Arduino (op Leonarde meest rechter pin)
- SDA naar SDA op Arduino (op Leonarde op een na meest rechter pin)
- Plus 3.3V
- Min

Thermometer

Van links naar rechts (gaatjes van blauwe blokje boven).

- naar pin 4 Arduino Leonarde
- Plus 3.3V
- Min

Arduino projects ideas

Arduino projects ideas

1. LED Blinking Traffic Light

- **Description**: Build a simple traffic light simulation with red, yellow, and green LEDs that cycle in sequence.
- **Learning Objectives**: Digital output, basic timing with delay(), and code structure (setup/loop).
- **Components**: 3 LEDs, resistors, breadboard, jumper wires.
- **Suggested Board**: Arduino UNO R4 Minima.
- **Code Concept**: Use digitalWrite() to turn LEDs on/off with timed delays.
- **Challenge**: Build a second traffic light that interacts with teh first and emulates a real crossing.

2. Button-Controlled Buzzer

- **Description**: Press a button to make a buzzer play a tone; press again to stop it.
- **Optional**: add a led that shows when te buzzer is playing.
- **Learning Objectives**: Digital input, conditional statements (if), basic sound generation.
- **Components**: Pushbutton, buzzer, resistor, breadboard.
- **Suggested Board**: Arduino Nano Every.
- **Code Concept**: Read button state with digitalRead() and use tone() for sound.

3. Temperature Monitor with LCD

- **Description**: Display room temperature on an LCD screen using a temperature sensor.

- **Learning Objectives**: Analog input, sensor interfacing, LCD output.
- **Components**: TMP36 or DHT11 sensor, 16x2 LCD, breadboard.
- **Suggested Board**: Arduino UNO R4 Minima.
- **Challenge**: add a led and/or buzzer that switches on when the temperature is outside of a preset range.

4. Auto lock PC/Laptop

- **Description**: Build a system that detects if a user is present at a computer using a motion or distance sensor. If no one is detected for a set time (e.g., 5 minutes), it sends a signal to shut down the PC.
- **Learning Objectives**: Sensor interfacing (analog/digital), timing logic, serial communication, basic PC interaction.
- **omponents**: HC-SR04 ultrasonic sensor (distance) or PIR sensor (motion),
- **Suggested Board:** Arduino UNO R4 Minima (simple) or Arduino Nano 33 IoT (for added connectivity).
- **Code Concept**:
    - Use pulseIn() (for HC-SR04) or digitalRead() (for PIR) to detect presence.
    - Implement a timer with millis() to track inactivity.
    - Send a lock command via Serial (software) or toggle a relay (hardware simulation).

PageESP32-WROOM-32S 32d is

The Dual Core 30pin ESP32-WROOM-32S 32d is compatible with the Arduino IDE. To get started, you'll need to install the ESP32 board definitions through the Arduino Board Manager. Here’s how:

1. **Install the Board Package:**
   In the Arduino IDE, open *File* > *Preferences* and add the following URL to the “Additional Boards Manager URLs” field:
   `https://dl.espressif.com/dl/package_esp32_index.json`
2. **Use the Board Manager:**
   Go to *Tools* > *Board* > *Boards Manager*, search for “ESP32,” and install the package provided by Espressif.
3. **Select Your Board:**
   Once installed, select the appropriate ESP32 board from *Tools* > *Board*. Your Dual Core ESP32-WROOM-32S should appear in the list, allowing you to program it using the familiar Arduino environment.

With these steps, you can leverage the Arduino IDE to develop and upload code to your ESP32 board.
